# Your First Steps in Machine Learning

Speaker:

**Vinod Venkatraman**

VP - Technology, Great Learning

# Who is this talk for?

Relevant for folks who..

- Want to get started with Machine Learning - ML101
- Heard about Machine Learning and wonder how it works
- Read a bit about Machine Learning but lost in jargons and buzz words
- Want a 1 hour plain english trailer of the ML world

# What will we learn?

- What is Machine Learning (ML)?
- Why do we need ML?
- Where are we already witnessing ML?
- But, how can a machine learn!
- Types of ML algorithms
- Let's use ML to solve a real life problem [Hands-On]
- What Next? How to learn more ML

# What is Machine Learning?

- When a machine learns without being explicitly programmed to do so
- Examples
  - A machine shortlisting resumes for a job
  - A machine recognizing handwritten digits

# Why do we need ML?

- To build systems which continuously learn, adapt and improve
- To handle the explosion of data
- To reduce mundane work for us
- To reduce errors, improve efficiency

# Where are we witnessing ML?

- Google Assistant
- Google Maps
- Netflix “Recommended movies for you”
- Online Advertising
- Credit Card Fraud Detection
- Medical Diagnosis
- Speech recognition
- Self Driving Cars

# But, how can a machine learn!

- What are machines good at?
- What kinds of things we want a machine to learn?
- What can a machine learn from?
- How can a machine learn from these?

# What are machines good at?

- Machines are extremely good with numbers..
  - Specially the numbers 0 and 1
- Machines are extremely fast in mathematical computations
- Machines are capable of remembering the past

# What can a machine learn from?

- Data
- Facts, past events and their outcomes
- Represented as numbers, remember they are awesome with numbers!

# What do we want a machine to learn?

- LEARN from past outcomes TO predict future outcomes
- LEARN from its mistakes TO make better predictions in the future
- LEARN from a given dataset TO detect patterns and insights in that same dataset

# How can a machine learn from data?

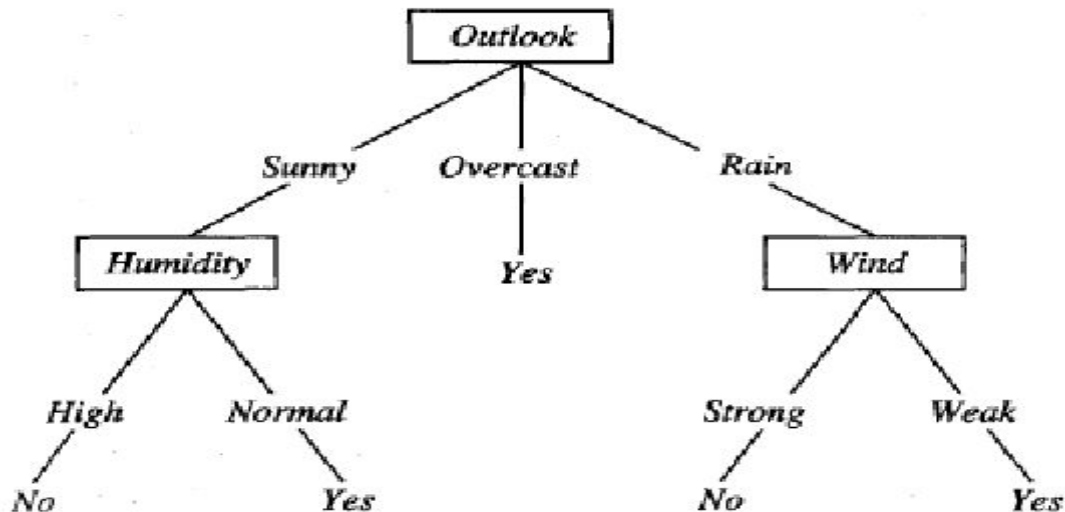

- Given historical data as a series of (input, output) pairs
  - Find a mathematical function which can generate output as close as possible to the actual outputs

**Regression Analysis**

# How can a machine learn from data?

- Generate a flowchart which given an input can generate the output

Decision Trees

# How can a machine learn from data?

- Group a given dataset into segments based on their positioning

**Cluster Analysis**

# How do we know the machine has learnt

- Train it with a portion of data - normally 70%
- Test it with the remaining data - normally 30%
- Measure the accuracy of the results
- This is called Train-Test cycle

# Basic ML Terminology

- Machine Learning Model
- Features
- Dependent Variable
- Training Dataset
- Test Dataset
- Precision and Recall

# Types of Machine Learning Algos

- Where we teach the machine with (inputs, outputs) so that it can generate output for new inputs
  - aka Supervised Learning
  - Regression Analysis, Decision Trees
- Where the machine learns on its own
  - aka Unsupervised Learning
  - Cluster Analysis

# Hands-On Exercises

- Let's build a Machine Learning Model which can predict weight of people based on their height
- Let's build a Machine Learning Model which can shortlist resumes

# Resources

- Code and Datasets used in Hands-On examples on Github
  - <https://github.com/vinodvr/first-steps-ml>

# Thank You
